

Hydraulic Christie Wrench

Quality you can afford

Savings you can't afford to miss

Christie Wrench - DFTW Range

By carefully focusing on the needs of our customers, W. Christie remain at the forefront of tooling technology.

Fully aware of the difficulties associated with flange bolting, the new Christie DFTW wrenches have an open hexagon designed to fit directly onto the nut or bolt head. This tooling is ideal for use on applications with limited overhead access or with fasteners having excessive thread protrusion.

Reduce costs – alter the hexagon size of a single head and use on various bolting applications.

Reducing sleeves allow for a change of sleeve, instead of a change of head, thus saving money by making each hexagon head versatile for a range of smaller fasteners.

(Note: The wall thickness of the hexagon head will increase the smaller the sleeve size).

HSE recognise that training is a must

The Health and Safety Executive are convinced that, "Torque tightening is a specialist skill. Only trained and competent personnel should undertake torque tightening, and they should use equipment which is correctly maintained and calibrated."

(Safety Division, June 2000)

Let Christie's personnel take the worry out of guiding your staff through the safe and correct operation of a range of torque tools.

Uni-swivel Coupler

Typically, hydraulic torque wrenches are used to tighten and un-tighten nuts and bolts in cramped and confined locations, and of course the hoses always seem to get in the way. In many cases, additional hazards are created as operators overstrain hoses or damage couplings in an attempt to make tooling fit. Christie's uni-swivel coupler (fitted as standard to all WHTW and DFTW models) can be rotated by hand through a full 360 degrees allowing hoses to be conveniently directed away from dangerous and awkward obstructions. Don't compromise on safety – Always insist on W. Christie.

Double swivel movement ensures versatility and operator comfort are not compromised.

360 degree swivel action on both X and Y axis ensures that the hoses are positioned where you want them – out of the way!

Hydraulic Torque Wrench Accuracy

Many manufacturers of hydraulic torque wrenches offer generic torque tables or pressure gauge overlays to support their products. Some actually offer these as promotional features, however, no matter how well they are produced, the fact remains that no two hydraulic torque wrenches are the same. Torque output varies, even between seemingly identical models, that is why at W. Christie all hydraulic products are individually calibrated, with all traceability to UK National Standards.

Don't compromise on tooling accuracy.

Cut out timely head change overs with this single pin design.

Reduce downtime when changing one hexagon head size for another. A single pin releases the head, so no additional tools are required for a retrofit.

High safety factor, 4 metre hydraulic hoses are supplied with all power packs.

Christie hoses benefit from a safety ratio of 4:1 made possible because of their seamless core construction and high tensile reinforcements.

Spring guards are fitted to the hose ends to prevent failure where hose meets coupling.

Christie Air and Electric Power Packs

This range of portable hydraulic power packs are the toughest on the market, combining effortless power with supreme performance.

Available in air or electric models these units have a powerful 690 bar (10,000 psi) operating pressure, whilst remaining light and portable.

Noise reduction

The Control of Noise at Work Regulations 2005 came into force, for industry sectors in Great Britain, on 6th April 2006. Under these regulations the level at which employers MUST provide hearing protection and hearing protection zones is 85 decibels (daily or weekly exposure).

Both the Micron and Xtra series air power packs are fitted with 'quiet air' silencer chambers reducing noise outputs and removing the need for hearing protection.

No more stopping to deal with hot or cold climate zones

Noise reduction is only one advantage with Christie pumps; the air silencer is routed through the oil tank and is designed to act as a highly efficient temperature regulator. Exhaust air cools the hydraulic oil, ideal for hot climates, whilst the opposite occurs in severe cold when warm oil around the chamber prevents silencers from freezing.

This innovation guarantees that Christie pumps can be used for longer periods in the harshest conditions.

Features

- The 'two stage pump' system ensures quick location and pressure build up, with automatic change to low pressure for final tightening.
- Oil level assessment made easy with the sight level gauge fitted as standard to the oil tank.
- Set torque accurately with the variable pressure control - don't overload the tool.
- With the operator in mind the 80mm diameter pressure gauge is positioned to be seen easily.
- Double acting operation is a must for use with hydraulic torque wrenches.

Hand operated pendant line that will not get in the way during operation.

Each standard air power pack is supplied with a hand held pendant control with coiled, triplex hose that stretches and retracts with the operator. The double button control eliminates the timely pressure build up techniques adopted by single button alternatives – speed up and stay safe.

Christie power packs don't rust – they work on and on.

The lubrication unit releases 1 drop of oil every 10 seconds to keep the mechanisms in good working order, whilst the water separator stops unwanted moisture from penetrating the unit. Avoid unnecessary downtime and costly repair bills.

Save time when altering your reaction angle
– a single release button mechanism
guarantees speed - whilst a 360 degree splined
body allows flexible orientation.

A simple lever mechanism un-locks and re-locks the reaction, and a push button release on the square drive ensures swift change over from bolt tightening to bolt loosening.

Buy or Hire?

FACT – companies needs differ. Capital expenditure is not always the best option; hiring equipment frees your capital for other potentially more profitable uses.

Christie Wrench – WHTW Range

Using a mono body design and the latest light weight alloy materials the WHTW series hydraulic torque wrench offers superb performance at a fraction of the weight. The WHTW tools are equipped with detachable square drives to be used with impact sockets and ancillaries.

Maintenance and Calibration

This equipment rarely breaks down, but a regular service schedule reduces the risk further. You don't need a workshop, no spares to stock or order, no fitters to pay, no health and safety records to keep and no unexpected repair bills - just use Christies. Its experience and resources will have you up and running with no loss of time or production - we work around you.

Minimise stockholding

Ownership can be expensive when equipment is idle - profit is using the tools not just owning them.

Good reasons to hire equipment

Equipment obsolescence

Equipment is changed and updated, make sure you are using the latest and fastest machines by hiring.

Tax allowances

Hire is 100% allowable immediately, no complicated depreciation sums to work out, no arguments with the revenue.

Right equipment for the job

Eliminate the costs of using the wrong size or type of equipment and don't restrict yourself to one type of tool when you can hire and choose the best model for the job.

Cost Control

Knowing the true cost of owning equipment is difficult; job costing is easier with hire.

Owning your equipment is sometimes the only option.

Whilst the hire option is ideal for one off jobs, break downs, strip downs and maintenance closures, these tools are robust enough to use on your regular bolting applications - then there is no comparison to the convenience of you owning the tooling.

Flexible hose movement can save time and avoid user frustration.

Difficult access problems are overcome with 360 degree uni-swivel connections that assist hose orientation, in the most awkward of applications, and aids operator comfort. Designated male and female ported couplings ensure correct connection.

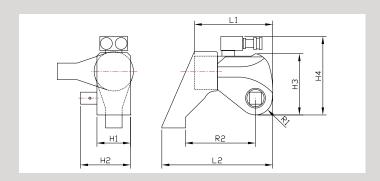

Minimise tooling width and reduce the risk of side loading with a range of direct fit sockets and adaptors.

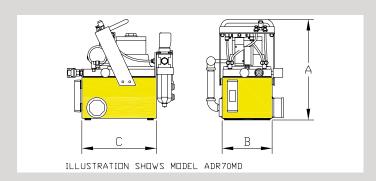

For those reduced head room requirements, or applications where safe tightening, and removal of socket head cap screws is key, the WHTW range has the facility to remove the square and replace with direct fit outputs.
